### (54) High-Q inductor for high frequency

(57) A high-Q inductor for high frequency, having a plurality of inductor elements formed in a plurality of IC wiring layers with a connection formed therebetween. The directions of the magnetic fields generated by the respective inductor elements are substantially the

same. With this construction, the section of the inductor is increased reducing the serial resistance component and an influence of a skin effect in a high-frequency range is eliminated increasing the Q value.

EP 1 008 997 A1

## Description

### BACKGROUND OF THE INVENTION

#### 1. Field of the Invention

[0001] The present invention relates to an inductor having a high Q value for use in high frequency in a semiconductor integrated circuit (IC).

#### 2. Description of the Related Art

[0002] A conventional inductor will be described with reference to Figure 9. Referring to Figure 9, the reference numeral 1 denotes an inductor section, 2 denotes a drawing interconnect formed in the first layer, 3 denotes a drawing interconnect formed in the second layer, 5 denotes a connection between the first and second layers, 7 denotes an interlayer film, and 8 denotes a smoothing film.

[0003] That is, in the conventional inductor, the inductor section is constructed of a single layer and the second layer is used for the drawing interconnect for connection with other components.

[0004] As one of characteristics of an inductor, it is generally known that in order to obtain a large inductance value, the line length of the inductor must be increased.

[0005] With the above conventional construction, however, when the line length is increased in order to obtain a large inductance value, the serial resistance component increases due to the resistance of a wiring material constituting the inductor, resulting in lowering the Q value of the inductor.

[0006] Further, the increased line length of the inductor tends to increase the size of the entire inductor.

### SUMMARY OF THE INVENTION

[0007] In view of the above problems, an object of the present invention is to provide an inductor having a high Q value while suppressing the serial resistance from increasing.

[0008] Another object of the present invention is to provide an inductor of which size is not increased even when the line length thereof is increased.

[0009] A high-Q inductor for high frequency of the first present invention is such inductor that one inductor has a plurality of inductor elements formed in a plurality of IC wiring layers respectively, and the directions of magnetic fields generated by the respective inductor elements are substantially the same.

[0010] A high-Q inductor for high frequency of the second present invention according to the first present invention, is such inductor that the plurality of inductor elements are connected in series.

[0011] A high-Q inductor for high frequency of the third present invention according to the first present

invention is such inductor that the plurality of inductor elements are connected in parallel.

[0012] A high-Q inductor for high frequency of the fourth present invention according to the first present invention, is such inductor that the plurality of inductor elements include a serial-connected circuit portion and a parallel-connected circuit portion.

[0013] A high-Q inductor for high frequency of the fifth present invention according to the first present invention, is such inductor that at least one of the inductor elements is in a meander shape or a spiral shape.

[0014] A high-Q inductor for high frequency of the sixth present invention according to any one of the first to fifth present inventions, is such inductor that a connection between the plurality of inductor elements is formed in an interlayer film disposed between the IC wiring layers in which the inductor elements are formed.

[0015] A high-Q inductor for high frequency of the seventh present invention according to the first present invention is such inductor that a drawing interconnect from the inductor element is formed in the IC wiring layer in which one of the inductor elements is formed.

[0016] The seventh present invention corresponds to FIG.1.

[0017] A high-Q inductor for high frequency of the eighth present invention according to the seventh present invention is such inductor that the plurality of inductor elements are in a spiral shape respectively and connected in parallel with each other, and one of the drawing interconnect is connected to a spiral center of the inductor element and drawn externally by being formed in one of the IC wiring layers, and

the spiral-shaped inductor element formed in the IC wiring layer used for the external drawing is cut off at positions where the drawing interconnect crosses, and cut-off ends of the inductor element are connected with each other by being connected with respective corresponding portions of the spiral-shaped inductor element formed in another one of the IC wiring layers.

[0018] The eighth present invention corresponds to FIG.3.

[0019] A high-Q inductor for high frequency of the ninth present invention according to any one of the first to sixth present inventions is such inductor that a drawing interconnect from the inductor element is formed in a wiring layer which is different from the IC wiring layers in which the inductor elements are formed.

[0020] The ninth present invention corresponds to FIG.2.

[0021] A high-Q inductor for high frequency of the tenth present invention according to the ninth present invention, is such inductor that a drawing interconnect and the inductor element to be connected with the drawing interconnect are connected via a connection formed in an interlayer film disposed between a wiring

layer in which the drawing interconnect is formed and the IC wiring layer in which the inductor element is formed.

[0022] The tenth present invention corresponds to FIG. 2.

[0023] A high-Q inductor for high frequency of the eleventh present invention according to the first present invention, is such inductor that the plurality of inductor elements are in a spiral shape respectively,

adjacent inductor elements of the plurality of inductor elements are connected with each other in such manner that the adjacent inductor elements are serially connected by connecting the spiral centers thereof with each other and outer ends thereof with each other, spiral directions of the adjacent inductor elements are in reverse from each other, and directions of the magnetic fields generated by the respective inductor elements are substantially the same.

[0024] The eleventh present invention corresponds to FIG. 4 and FIG. 5.

[0025] A high-Q inductor for high frequency of the twelfth present invention according to the first present invention, is such inductor that the plurality of inductor elements are in a spiral shape respectively,

the plurality of inductor elements are alternately connected with each another in such manner that the inductor elements are, serially connected by connecting the centers thereof with each other and outer ends thereof with each other, the spiral directions of adjacent inductor elements repeats the same and the reverse in order, and the directions of the magnetic fields generated by the respective inductor elements are substantially the same.

[0026] The twelfth present invention corresponds to FIG. 6.

#### BRIEF DESCRIPTION OF THE DRAWINGS

[0027]

Figure 1 shows an inductor of Embodiment 1 of the present invention;  
Figure 2 shows an inductor of Embodiment 2 of the present invention;  
Figure 3 shows an inductor of Embodiment 3 of the present invention;  
Figure 4 shows an inductor of Embodiment 4 of the present invention;  
Figure 5 is a schematic view illustrating another inductor according to the present invention;  
Figure 6 is a schematic view illustrating yet another

inductor according to the present invention;

Figure 7 is a graph showing comparison of the present invention with a conventional inductor;

Figure 8 is another graph showing comparison of the present invention with the conventional inductor; and

Figure 9 shows a conventional inductor.

#### DESCRIPTION OF THE PREFERRED EMBODIMENTS

[0028] Embodiments of the present invention will be described with reference to the relevant drawings.

(Embodiment 1)

[0029] Figure 1 shows the first embodiment of the high-Q inductor for high frequency according to the present invention. Referring to Figure 1, the reference numeral 11 denotes a meander-type first-layer inductor section (the "inductor section" as used herein corresponds to an "inductor element" to be recited in the claims), 12 and 13 denote first-layer drawing interconnects, 14 denotes a second-layer inductor section, 15 and 16 denote connections between the first and second layers, 17 denotes an interlayer film, and 18 denotes a smoothing film.

[0030] Each of the connections 15 and 16 is composed of nine contact portions each having a size of about 1  $\mu\text{m}$  square, for example.

[0031] In this embodiment, therefore, the inductor section, which is conventionally constructed using only one layer, is of a two-layer structure where two inductor sections are formed in the first and second layers and connected in parallel with each other.

[0032] The above construction makes it possible to obtain a high Q-value inductor for high frequency which overcomes the conventional problem of having a large serial resistance component in low frequency and high frequency and thus a lowered Q value, by increasing the cross section and suppressing lowering of the Q value which otherwise occurs due to a skin effect in high frequency.

[0033] It should be noted that the first and second layers may be connected in parallel over the entire inductor sections. This construction is also included in the present invention.

(Embodiment 2)

[0034] Figure 2 shows the second embodiment of the high-Q inductor for high frequency according to the present invention. Referring to Figure 2, the reference numeral 21 denotes a spiral-shaped first-layer inductor section, 22 denotes a first-layer drawing interconnect, 23 denotes a spiral-shaped second-layer inductor section, 24 denotes a drawing interconnect from the second-layer inductor section 23 formed in the third layer,

25 and 26 denote connections between the first and second layers, 27 and 28 denote interlayer films, 29 denotes a smoothing film, and 210 denotes a connection between the second and third layers. The first-layer inductor section 22 and the second-layer inductor section 23 are spiraled in the same direction.

[0035] In this embodiment, therefore, the inductor section, which is conventionally constructed using only one layer, is of a two-layer structure where the inductor sections 22 and 23 are respectively formed in the first and second layers and connected in parallel with each other. This construction makes it possible to obtain a high Q-value inductor for high frequency which overcomes the conventional problem of having a large serial resistance component in low frequency and high frequency and thus a lowered Q value, by increasing the cross section and suppressing lowering of the Q value which otherwise occurs due to a skin effect in high frequency.

[0036] It should be noted that the first and second layers may be connected in parallel over the entire inductor sections. This construction is also included in the present invention.

[0037] In this embodiment, the three-layer inductor was exemplified. It is also possible to construct a similar structure composed of four or more layers with a drawing interconnect being formed in the bottom layer.

#### (Embodiment 3)

[0038] Figure 3 shows the third embodiment of the high-Q inductor for high frequency according to the present invention. Referring to Figure 3, the reference numeral 31 denotes a spiral-shaped first-layer inductor section, 32 denotes a first-layer drawing interconnect, 33 denotes a spiral-shaped second-layer inductor section, 34 denotes a second-layer drawing interconnect, 35 denotes connections between the first and second layers, 37 denotes an interlayer film, and 38 denotes a smoothing film.

[0039] The first and second inductor sections 31 and 33 are connected in parallel with each other.

[0040] Embodiment 3 is characterized in that the second-layer drawing interconnect 34 is formed using the layer in which the second-layer inductor section 33 is formed. In order to prevent the second-layer inductor section 33 from being in contact with the drawing interconnect 34 in the same layer, the second-layer inductor section 33 is cut off at the positions where the drawing interconnect 34 crosses. The cut-off ends of the inductor section 33 are connected with the first-layer inductor section 31 via the connections 35. By this construction, the second-layer inductor section 33 can serve as one substantially spiral-shaped inductor section.

[0041] In this embodiment, therefore, the inductor section, which is conventionally constructed using only one layer, is of a two-layer structure where inductor sections are formed in the first and second layers and con-

nected in parallel with each other. Furthermore, the inductor sections are formed in the layers in which the drawing interconnects are formed. As a result, it is possible, even in a process where a smaller number of wiring layers are used, to obtain a high Q-value inductor for high frequency which overcomes the conventional problem of having a large serial resistance component in low frequency and high frequency and thus a lowered Q value, by increasing the cross section and suppressing lowering of the Q value which otherwise occurs due to a skin effect in high frequency.

[0042] Thus, Embodiment 3 is characterized in that one of the drawing interconnects is formed using the wiring layer for the inductor section, which is different from Embodiment 2 where the layer for forming the drawing interconnect is separately provided.

[0043] It should be noted that the first and second layers may be connected in parallel over the entire inductor sections. This construction is also included in the present invention.

[0044] In this embodiment, the two-layer inductor was exemplified. It is also possible to construct a similar structure composed of three or more layers with a drawing interconnect being formed in any of the layers. In this case, portions of an inductor section at which the drawing interconnect crosses can be connected with an adjacent upper or lower inductor section.

[0045] Figures 7 and 8 are graphs showing comparison of performances of the two-layer inductor according to the present invention and a conventional one-layer inductor.

[0046] Figure 7 is a graph obtained by plotting a variation of the resistance (R) with respect to the length (L). It is observed from this figure that R is smaller in the two-layer inductor according to the present invention.

[0047] Figure 8 is a graph obtained by plotting a variation of the Q value (Q) with respect to the length (L). It is observed from this figure that Q is greater in the two-layer inductor according to the present invention.

#### (Embodiment 4)

[0048] Figure 4 shows the fourth embodiment of the high-Q inductor for high frequency according to the present invention. Referring to Figure 4, the reference numeral 41 denotes a spiral-shaped first-layer inductor section, 42 denotes a first-layer drawing interconnect, 43 denotes a connection between the first and second layers, 44 denotes a spiral-shaped second-layer inductor section, 45 denotes a connection between the second and third layers, 46 denotes a spiral-shaped third-layer inductor section, 47 denotes a connection between the third and fourth layers, 48 denotes a spiral-shaped fourth-layer inductor section, 49 denotes a fourth-layer drawing interconnect, 410, 411, and 412 denote interlayer films, and 413 denotes a smoothing film.

[0049] In this embodiment, the adjacent inductor

sections are connected with each other. Specifically, the centers or the outer ends of the adjacent inductor sections are connected with each other. These inductor sections are therefore connected in series with each other.

[0050] In this embodiment, the second-layer and fourth-layer inductor sections have a shape inverted upside down from that of the first-layer and third-layer inductor sections. By this arrangement, the directions of the magnetic fields generated by the respective inductor sections are the same, resulting in effective coupling.

[0051] In the conventional structure where the inductor section is constructed using only a single layer, when the entire length of the inductor section is increased to obtain a high Q value, the size of the inductor section also increases. On the contrary, in Embodiment 4, since the length of the inductor sections is increased stereoscopically as a whole, the resultant size is compact.

[0052] The four-layer structure was described in this embodiment. However, as shown in Figure 5, the number of layers may be increased to five or six, for example, in a similar structure. The structure is simpler when the number of layers is even, because the drawing interconnect can be formed to be connected with the outer end of the bottom inductor section.

[0053] When the number of layers is odd, the drawing interconnect can be arranged in a manner described in Figure 2 or 3.

[0054] Alternatively, as shown in Figure 6, a pair of adjacent inductor sectors may have the same spiral direction, and adjacent pairs of adjacent inductor sectors may have different spiral directions. In this case, one inductor sector of one pair is connected with one of another pair as shown in Figure 6 so that all the inductor sectors are serially connected.

[0055] In the above case, also, the directions of the magnetic fields generated by the respective inductor sectors are the same, resulting in effective coupling.

[0056] Thus, according to the present invention, the inductor section, which is conventionally constructed of a single wiring layer, is of a multi-layer structure. As a result, a high Q-value inductor which has a reduced serial resistance component and is free from an influence of a skin effect can be fabricated in an IC.

[0057] Many modifications and variations of the present invention will be apparent to those skilled in the art without departing from the scope and spirit of the invention. It should therefore be understood that the present invention is not limited to the specific embodiments illustrated herein but only defined by the appended claims.

#### Claims

1. A high-Q inductor for high frequency, wherein one inductor has a plurality of inductor elements formed in a plurality of IC wiring layers respectively, and the

directions of magnetic fields generated by the respective inductor elements are substantially the same.

2. A high-Q inductor for high frequency according to claim 1, wherein the plurality of inductor elements are connected in series.
3. A high-Q inductor for high frequency according to claim 1, wherein the plurality of inductor elements are connected in parallel.
4. A high-Q inductor for high frequency according to claim 1, wherein the plurality of inductor elements include a serial-connected circuit portion and a parallel-connected circuit portion.
5. A high-Q inductor for high frequency according to claim 1, wherein at least one of the inductor elements is in a meander shape or a spiral shape.
6. A high-Q inductor for high frequency according to any of claims 1 to 5, wherein a connection between the plurality of inductor elements is formed in an interlayer film disposed between the IC wiring layers in which the inductor elements are formed.
7. A high-Q inductor for high frequency according to claim 1, wherein a drawing interconnect from the inductor element is formed in the IC wiring layer in which one of the inductor elements is formed.
8. A high-Q inductor for high frequency according to claim 7, wherein the plurality of inductor elements are in a spiral shape respectively and connected in parallel with each other, and one of the drawing interconnect is connected to a spiral center of the inductor element and drawn externally by being formed in one of the IC wiring layers, and  
the spiral-shaped inductor element formed in the IC wiring layer used for the external drawing is cut off at positions where the drawing interconnect crosses, and cut-off ends of the inductor element are connected with each other by being connected with respective corresponding portions of the spiral-shaped inductor element formed in another one of the IC wiring layers.
9. A high-Q inductor for high frequency according to any of claims 1 to 6, wherein a drawing interconnect from the inductor element is formed in a wiring layer which is different from the IC wiring layers in which the inductor elements are formed.
10. A high-Q inductor for high frequency according to claim 9, wherein a drawing interconnect and the

inductor element to be connected with the drawing interconnect are connected via an connection formed in an interlayer film disposed between a wiring layer in which the drawing interconnect is formed and the IC wiring layer in which the inductor element is formed. 5

11. A high-Q inductor for high frequency according to claim 1, wherein the plurality of inductor elements are in a spiral shape respectively, 10

adjacent inductor elements of the plurality of inductor elements are connected with each other in such manner that the adjacent inductor elements are serially connected by connecting the spiral centers thereof with each other and outer ends thereof with each other, spiral directions of the adjacent inductor elements are in reverse from each other, and directions of the magnetic fields generated by the respective inductor elements are substantially the same. 15 20

12. A high-Q inductor for high frequency according to claim 1, wherein the plurality of inductor elements are in a spiral shape respectively, 25

the plurality of inductor elements are alternately connected with each other in such manner that the inductor elements are serially connected by connecting the centers thereof with each other and outer ends thereof with each other, the spiral directions of adjacent inductor elements repeats the same and the reverse in order, and the directions of the magnetic fields generated by the respective inductor elements are substantially the same. 30 35 40 45 50 55
